Chapter 1

The page is the unit of thought. A book is not a stream of text but a sequence of surfaces, each with its own weight, margin, and pause. When software forgets that, reading becomes scrolling, and scrolling has no edges.

Margins are not empty space. They are the room a page needs to breathe, and the place where a thumb rests without covering a word. Cropping them away is sometimes the difference between reading and squinting.

Typography carries the argument. A page set in a book face at a comfortable measure asks to be read slowly; a page set in a UI face at a narrow measure asks to be skimmed. The reader should inherit the book's decisions, not overwrite them.

A good page turn is physical without being literal. It has weight, a shadow, and a direction. It can be interrupted. When it commits, it commits completely, and the next page is already waiting underneath.

Resuming is a promise. The reader closes the book in a queue, opens it a day later, and expects the same sentence to be under their eyes. Anything less is a small betrayal that compounds.

Selection is a conversation with the text. Lift a phrase, and the app should offer to take it somewhere useful, then get out of the way. It should never pretend to be the thing it is sending you to.
